Publications gateway number: GOV-15396

**National protocol for COVID-19 mRNA vaccine (5 to 17 years of age)**

Reference no: COVID-19 mRNA vaccine protocol (5 to 17 years of age)
Version no: v02.00
Valid from: 19 September 2023
Expiry date: 1 April 2024

This protocol is for the administration of COVID-19 mRNA vaccine to children and young people aged 5 to 17 years in accordance with the national COVID-19 vaccination programme.

This protocol is for the administration of COVID-19 mRNA vaccine by appropriately trained persons in accordance with regulation 247A of the Human Medicines Regulations 2012 (HMR 2012), inserted by The Human Medicines (Coronavirus and Influenza) (Amendment) Regulations 2020.

The UK Health Security Agency (UKHSA) has developed this protocol for authorisation by or on behalf of the Secretary of State for Health and Social Care to facilitate the delivery of the national COVID-19 vaccination programme commissioned by NHS England (NHSE).

This protocol may be followed wholly from assessment through to post-vaccination by an appropriately registered healthcare professional (see Characteristics of staff). Alternatively, multiple persons may undertake stages in the vaccination pathway in accordance with this protocol. Where multiple person models are used, the service provider or contractor must ensure that all elements of the protocol are complied with in the provision of vaccination to each individual. The provider or contractor is responsible for ensuring that persons are trained and competent to safely deliver the activity they are employed to provide under this protocol. As a minimum, competence requirements stipulated in the protocol under Characteristics of staff must be adhered to.

The provider or contractor and registered healthcare professionals are responsible for ensuring that they have adequate and appropriate indemnity cover.

Persons must be authorised by name to work under this protocol. They must ensure they meet the staff characteristics for the activity they are undertaking, make a declaration of competence and be authorised in writing. This can be done by completing Section 4 of this protocol or maintaining an equivalent electronic record.

A clinical supervisor, who must be a registered doctor, nurse or pharmacist trained and competent in all aspects of the protocol, must be present and take overall responsibility for provision of vaccination under the protocol at all times and be identifiable to service users. The final dilution and drawing up of the vaccine has its own supervision requirements in accordance with Part 1 of the HMR 2012 and will need to be done by, or under the supervision of a registered doctor, nurse or pharmacist. If a vaccination service is being provided at scale, the clinical supervisor should only take on specific supervision requirements in relation to the dilution and drawing up of the vaccine, if this can be done safely alongside their overarching role. Any time the protocol is used, the name of the clinical supervisor taking responsibility and all the people working under different stages of the protocol must be recorded for the session. The clinical supervisor has ultimate responsibility for safe care being provided under the terms of the protocol. Staff working under the protocol may be supported by additional registered healthcare professionals, but the clinical
supervisor retains overall responsibility. Staff working to the protocol must understand who the clinical supervisor for their practice at any time is and can only proceed with their authority. The clinical supervisor may withdraw this authority for all members of staff or individual members of staff at any time and has authority to stop and start service provision under the protocol as necessary. Every member of staff has a responsibility to, and should, report immediately to the clinical supervisor any concerns they have about working under the protocol in general or about a specific individual, process, issue or event.

Operation under this protocol is the responsibility of service providers or contractors. Provider organisations or contractors using this protocol should retain copies, along with the details of those authorised to work under it, for 25 years after the protocol expires.

Individual users must check that they are using the current version of this protocol and current versions of any documents this protocol refers to. Amendments may become necessary prior to the published expiry date. Current versions of national protocols for COVID-19 vaccines, authorised by or on behalf of the Secretary of State for Health and Social Care in accordance with regulation 247A of the HMR 2012, can be found via: COVID-19 vaccination programme

Any concerns regarding the content of this protocol should be addressed to: immunisation@ukhsa.gov.uk

1. Ministerial authorisation

This protocol is not legally valid, in accordance with regulation 247A of the HMR 2012, inserted by the Human Medicines (Coronavirus and Influenza) (Amendment) Regulations 2020, until it is approved by or on behalf of the Secretary of State for Health and Social Care.

On 19 September 2023, Department of Health and Social Care Ministers approved this protocol in accordance with regulation 247A of HMR 2012.

Any provider or contractor administering COVID-19 mRNA vaccine under this protocol must work strictly within the terms of this protocol and contractual arrangements with the commissioner, for the delivery of the national COVID-19 vaccination programme.

Assembly, final preparation and administration of vaccines supplied and administered under this protocol must be subject to NHS governance arrangements and standard operating procedures that ensure that the safety, quality or efficacy of the product is not compromised. The assembly, final preparation and administration of the vaccines should also be in accordance with the manufacturer's instructions in the product's UK Summary of Product Characteristics (SPC) and in accordance with official national recommendations.

Note: The national COVID-19 vaccination programme may also be provided under patient group direction or on a patient-specific basis (that is, by or on the directions of an appropriate independent prescriber, such as under a patient specific direction (PSD)). Supply and administration in these instances should be in accordance with contractual arrangements with the Commissioner for the delivery of the national COVID-19 vaccination programme and are not related to this protocol.
2. Characteristics of staff

</thead>
</table>
| This protocol may be followed wholly from assessment through to post-vaccination by an appropriately registered healthcare professional (see Table 2). Alternatively, multiple persons may undertake stages in the vaccination pathway in accordance with this protocol. Where multiple person models are used, the service provider/contractor must ensure that all elements of the protocol are complied with, in the provision of vaccination to each individual. The service provider/contractor is responsible for ensuring that there is a clinical supervisor present at all times and that persons are trained and competent to safely deliver the activity they are employed to provide under this protocol. As a minimum, competence requirements stipulated in the protocol must be adhered to.

The provider/contractor and registered healthcare professionals are responsible for ensuring that they have adequate and appropriate indemnity cover.

This protocol is separated into operational stages of activity as outlined in Table 1.

The clinical supervisor must be a registered doctor, nurse or pharmacist trained and competent in all aspects of the protocol and provide clinical supervision (see page 1 and 2) for the overall provision of clinical care provided under the legal authority of the protocol.

COVID-19 mRNA vaccine PGD (aged 5 to 17 years) v2.00 Valid from 19 September 2023 Expiry 1 April 2024 Page 6 of 27
### Stage 1: Assessment of the individual presenting for vaccination

<table>
<thead>
<tr>
<th>Activity stage 1a:</th>
<th>Assess the individual presenting for vaccination. If they are not eligible for vaccination or need to return at a later date, advise the individual, parent or carer accordingly.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clinical condition or situation to which this protocol applies</td>
<td>COVID-19 vaccination is indicated for the active immunisation of children and young people from 5 to 17 years of age for the prevention of coronavirus disease (COVID-19) caused by the SARS-CoV-2 virus. Immunisation is indicated in accordance with the national COVID-19 vaccination programme (see COVID-19 vaccination programme page), recommendations given in Chapter 14a of the ‘Green Book’ (hereafter referred to as Chapter 14a), and subsequent correspondence and publications from the UKHSA and NHSE.</td>
</tr>
</tbody>
</table>
| Criteria for inclusion | COVID-19 mRNA vaccine should be offered to children and young people from 5 to 17 years of age in accordance with the recommendations in Chapter 14a. Individuals are eligible for different vaccines based on their age and risk group (see Table ).

The following criteria apply to all individuals irrespective of prior COVID-19 immunisation status.

**Individuals who have not already received a dose during the current seasonal campaign,** who are:

(i) **aged 5 to 17 years** and
   - in a clinical risk group, as defined in Tables 3 and 4 of Chapter 14a
   - included in the recommended cohort(s) for vaccination, if and when JCVI, DHSC or other appropriate authority recommend an emergency surge vaccine response is required

(ii) **aged 12 to 17 years** and
   - are household contacts of immunosuppressed individuals, as defined in Tables 3 and 4 of Chapter 14a

(iii) **aged 16 or 17 years** and are
   - carers: those who are eligible for a carer’s allowance, or who are a sole or primary carer of an elderly or disabled individual who are themselves defined as clinically vulnerable to COVID-19 infection (as defined in Chapter 14a)
   - frontline health and social care workers

| Criteria for exclusion | Individuals for whom valid consent has not been obtained (for further information on consent, see Green Book Chapter 2). A number of UKHSA resources are available to inform consent (see Written information to be given to patient, parent or carer section).

As of 30 June 2023, the evergreen offer of two primary doses of COVID-19 vaccine ended. Therefore, individuals who do not fall into a clinical risk or other eligible group are not eligible for vaccination.

**Individuals who:**
- are aged 18 years and over
- are aged under 5 years

---

2 Exclusion under this protocol does not necessarily mean the medication is contraindicated, but it would be outside its remit and another form of authorisation will be required.
### Criteria for exclusion (continued)

- do not meet any of the criteria for inclusion, irrespective of prior vaccination status or previous vaccine eligibility
- have already received a dose of COVID-19 vaccine in the last 3 months
- are about to commence or undergo new or intensified immunosuppressive treatment (see Special considerations and additional information)
- have had a previous systemic allergic reaction (including immediate-onset anaphylaxis) to a previous dose of a COVID-19 mRNA vaccine or to any component or residue from the manufacturing process\(^3\) in the COVID-19 mRNA vaccines
- have experienced myocarditis or pericarditis determined as likely to be related to previous COVID-19 vaccination
- are suffering from acute severe illness (the presence of a minor infection is not a contraindication for vaccination)

### Cautions including any relevant action to be taken

Facilities for management of anaphylaxis should be available at all vaccination sites (see Chapter 8 of the Green Book and advice issued by the Resuscitation Council UK).

The 15 minute observation period following vaccination with the COVID-19 vaccines has been suspended for individuals who have no history of allergy (see off-label use section below and Chapter 14a).

Following COVID-19 vaccine administration, individuals without a history of allergy should be:

- observed for any immediate reactions whilst they are receiving any verbal post vaccination information and leaving the premises
- informed about the signs and symptoms of anaphylaxis and how to access immediate healthcare advice in the event of displaying any symptoms. In some settings, for example domiciliary vaccination, this may require a responsible adult to be present for at least 15 minutes after vaccination
- where applicable, advised not to drive for 15 minutes after vaccination, as fainting can occur following vaccination

Individuals with a personal history of allergy should be managed in line with Chapter 14a, Table 5.

Special precautions, such as those outlined in Chapter 14a (flowchart for managing patients who have allergic reactions to a previous dose of COVID-19 vaccine) are advised for individuals with a personal history of allergy including a:

- prior non-anaphylaxis allergic reaction to COVID-19 vaccine
- history of immediate anaphylaxis to multiple, different drug classes, with the trigger unidentified (this may indicate polyethylene glycol (PEG) allergy)
- history of anaphylaxis to a vaccine, injected antibody preparation or a medicine likely to contain PEG (such as depot steroid injection, laxative)
- history of idiopathic anaphylaxis

Individuals with undiagnosed PEG allergy often have a history of immediate-onset unexplained anaphylaxis or anaphylaxis to multiple classes of drugs. Such individuals should not be vaccinated with any of the Comirnaty® COVID-19 mRNA vaccines, except on the expert advice of an allergy specialist or where at least one dose of the same vaccine has been tolerated previously. A PSD is therefore required for administering COVID-19 vaccines to these individuals.

Where individuals experienced a possible allergic reaction to a dose of COVID-19 vaccine, follow the guidance in Chapter 14a in relation to the administration of subsequent doses.

Individuals with non-allergic reactions (vasovagal episodes, non-urticarial skin reaction or non-specific symptoms) to a COVID-19 vaccine can receive subsequent doses of vaccine in any vaccination setting. Observation for 15

---

\(^3\) The Comirnaty vaccines contain polyethylene glycol (PEG); refer to the respective SPC for a full list of excipients.
minutes is recommended for these individuals.

No specific management is required for individuals with a family history of allergies.

Syncope (fainting) can occur following, or even before, any vaccination as a psychogenic response to the needle injection, particularly in adolescents. This can be accompanied by several neurological signs such as transient visual disturbance, paraesthesia and tonic-clonic limb movements during recovery. It is important that procedures are in place to avoid injury from faints.

Individuals with a bleeding disorder may develop a haematoma at the injection site. Individuals with bleeding disorders may be vaccinated intramuscularly if, in the opinion of a doctor familiar with the individual's bleeding risk, vaccines or similar small volume intramuscular injections can be administered with reasonable safety by this route. If the individual receives medication or other treatment to reduce bleeding, for example treatment for haemophilia, intramuscular vaccination can be scheduled shortly after such medication or treatment is administered.

Individuals on stable anticoagulation therapy, including individuals on warfarin who are up to date with their scheduled INR testing and whose latest INR was below the upper threshold of their therapeutic range, can receive intramuscular vaccination. A fine needle (23 gauge or 25 gauge) should be used for the vaccination, followed by firm pressure applied to the site (without rubbing) for at least 2 minutes. If in any doubt, consult with the clinician responsible for prescribing or monitoring the individual’s anticoagulant therapy. The individual, parent or carer should be informed about the risk of haematoma from the injection.

Very rare reports have been received of Guillain-Barré Syndrome (GBS) following COVID-19 vaccination (further information is available in Chapter 14a). Healthcare professionals should be alert to the signs and symptoms of GBS to ensure correct diagnosis and rule out other causes, in order to initiate adequate supportive care and treatment. Individuals who have a history of GBS should be vaccinated as recommended for their age and underlying risk status. In those who are diagnosed with GBS after the first dose of vaccine, the balance of risk-benefit is in favour of vaccination.

Guidance produced by the UK Immune Thrombocytopenia (ITP) Forum Working Party advises discussing the potential for a fall in platelet count in individuals with a history of ITP receiving any COVID-19 vaccine and recommends a platelet count check 2 to 5 days after the vaccine (British Society for Haematology-COVID-19).

Past history of COVID-19 infection

There are no safety concerns from vaccinating individuals with a past history of COVID-19 infection, or with detectable COVID-19 antibody. Vaccination of individuals who may be infected, asymptomatic or incubating COVID-19 infection is unlikely to have a detrimental effect on the illness, though those with suspected COVID-19 infection should not attend vaccination sessions to avoid infecting others. As clinical deterioration can occur up to 2 weeks after infection, vaccination should be deferred until clinical recovery.

Having prolonged COVID-19 symptoms is not a contraindication to receiving COVID-19 vaccine but if the individual is seriously debilitated, still under active investigation, or has evidence of recent deterioration, deferral of vaccination may be considered to avoid incorrect attribution of any change in the person’s underlying condition to the vaccine.
Dose and frequency of administration

Vaccination should be offered to children and young people eligible for the current campaign, in accordance with the recommendations from the JCVI and in Chapter 14a at a minimum interval of 3 months from the previous dose. As the primary course has reduced from 2 doses to a single dose, there is no requirement to complete the regime before receiving a booster dose.

Table 3: Age specific recommendations on vaccine type and dose regimes

<table>
<thead>
<tr>
<th>Age</th>
<th>Recommended COVID-19 vaccine(s)</th>

<td>0.3ml</td>
</tr>
</tbody>
</table>

In line with Chapter 14a, there is no requirement to administer the same vaccine brand as previously administered.

Vaccination in incompletely vaccinated or previously unvaccinated individuals

If the primary course was interrupted or delayed before Autumn 2023, doses should neither be repeated or the course resumed, in line with JCVI recommendations to change to a single dose regime. Previously unvaccinated children or young people should be offered a single dose of COVID-19 vaccine as recommended in Table 3.

The main exception would be for those about to commence immunosuppressive treatment (see Special considerations and additional information).

Interval post COVID-19 infection

Refer to Cautions section (Past history of COVID-19) for information.

Action to be taken if the individual is excluded

The risk to the individual of not being immunised must be considered. The indications for risk groups are not exhaustive and the healthcare practitioner should consider the risk of COVID-19 exacerbating any underlying disease an individual may have, as well as the risk of serious illness from COVID-19 itself. Where appropriate, such individuals should be referred for assessment of clinical risk. Where risk is identified as equivalent to those currently eligible for immunisation, vaccination may be provided by an appropriate prescriber or on a patient-specific basis, under a PSD.

For individuals who have had a previous systemic allergic reaction (including immediate-onset anaphylaxis) to a previous dose of COVID-19 mRNA vaccine, or any component of the vaccine, advice should be sought from an allergy specialist. Vaccination may be provided by an appropriate prescriber or on a patient-specific basis, under a PSD.

Individuals who have experienced myocarditis or pericarditis following COVID-19 vaccination should be assessed by an appropriate clinician to determine whether it is likely to be vaccine related. As the mechanism of action and risk of recurrence

---

4 As outlined in the Green Book, vaccines that target the latest variant are preferable. However, an available, authorised and age-appropriate vaccine should be offered without delay, particularly to individuals at highest risk.
### Action to be taken if the individual is excluded (continued)

of myocarditis and pericarditis are being investigated, the current advice is that an individual's second or subsequent doses should be deferred pending further investigation. Following investigation, any subsequent dose should be provided by an appropriate prescriber or on a patient-specific basis, under a PSD.

Individuals who commenced but did not complete their primary course prior to the current seasonal campaign no longer require a second dose. If the individual continues to meet inclusion criteria, a dose can be given a minimum of 3 months from the date of the last administered dose, if this is possible within the campaign period.

Otherwise, individuals who have never received a dose of COVID-19 and do not meet inclusion criteria, or who were previously eligible for a booster during a previous but not the current vaccination campaign, should be reassured (or their parent or carer) that the evidence doesn’t currently support a need to vaccinate them. If new evidence means they are considered to be at high risk of during a future campaign, they will then be invited for vaccination.

When the seasonal vaccination campaign has ended, individuals with severe immunosuppression (as defined in Boxes 1 and 2 of Chapter 14a) can be considered for vaccination outside of campaign periods, in accordance with the Green Book. A decision to proceed would be subject to individual clinical decision and therefore a PSD should be used to administer the vaccine.

If COVID-19 vaccine has been given in the preceding 3 months, advise the individual to return when they are next invited forward for vaccination, which may coincide with the next seasonal vaccine campaign.

In case of postponement due to acute illness, advise when the individual can be vaccinated and if possible, ensure another appointment is arranged.

Document the reason for exclusion and any action taken.

### Action to be taken if the individual or carer declines treatment

Informed consent, from the individual or a person legally able to act on the person’s behalf, must be obtained for each administration and recorded appropriately. For further information on consent see Chapter 2 of the Green Book.

Advise the individual, parent or carer about the protective effects of the vaccine, the risks of infection and potential complications if not immunised.

Document advice given and the decision reached.

Inform or refer to the GP or a prescriber as appropriate.

### Arrangements for referral

As per local policy.
### Stage 1b: Description of treatment

<table>
<thead>
<tr>
<th>Activity stage 1b:</th>
<th>Consider any relevant cautions, interactions or adverse drug reactions. Provide advice to the individual and obtain informed consent. Record individual’s consent and ensure vaccinator, if another person, is informed of the vaccine product to be administered.</th>
</tr>
</thead>
</table>
| Name, strength and formulation of drug | **Comirnaty® Omicron XBB.1.5 (30 micrograms/dose) dispersion for injection COVID-19 mRNA vaccine (nucleoside modified)**  
This is a multidose vial which **must not be diluted**.  
One vial (2.25ml) contains 6 doses of 0.3ml.  
One dose (0.3ml) contains 30 micrograms of raxtozinameran, a COVID-19 mRNA vaccine (embedded in lipid nanoparticles).  
This product is supplied in vials with a grey plastic cap. |
| | **Comirnaty® Omicron XBB.1.5 (10 micrograms/dose) dispersion for injection COVID-19 mRNA vaccine (nucleoside modified)**  
This is a multidose vial which **must not be diluted**.  
One vial (2.25ml) contains 6 doses of 0.3ml.  
One dose (0.3ml) contains 10 micrograms of raxtozinameran, a COVID-19 mRNA vaccine (embedded in lipid nanoparticles).  
This product is supplied in vials with a dark blue plastic cap. |
| | **Comirnaty® Original/Omicron BA.4-5 (15/15 micrograms)/dose dispersion for injection COVID-19 mRNA vaccine (nucleoside modified)**  
This is a multidose vial which **must not be diluted**.  
One vial (2.25ml) contains 6 doses of 0.3ml.  
One dose (0.3ml) contains 15 micrograms of tozinameran and 15 micrograms of famtozinameran, embedded in lipid nanoparticles.  
The product is supplied in vials with a grey plastic cap. |
| Legal category | Prescription only medicine (POM). |
| Black triangle | All recommended COVID-19 vaccines are black triangle products. As new vaccine products, the Medicines and Healthcare products Regulatory Agency (MHRA) has a specific interest in the reporting of adverse drug reactions for these products. |
| Off-label use | **Allergy**  
The SPCs for all strengths of Comirnaty COVID-19 mRNA recommend close observation for at least 15 minutes following vaccination. Following careful review of the safety data by the MHRA and advice from the Commission on Human Medicines, the 15 minute observation has since been suspended or for individuals who have no history of allergy following vaccination with all COVID-19 vaccines.  
However, the individual, parent or carer should be informed about the signs and symptoms of anaphylaxis and how to access immediate healthcare advice in the event of displaying any symptoms. In some settings, for example domiciliary vaccination, this may require a responsible adult to be present for at least 15 minutes after vaccination.  
Where applicable, individuals should be advised not to drive for 15 minutes after vaccination, as fainting can occur. |

(continued over page)
### Off-label use (continued)

Individuals with a personal history of allergy should be managed in line with [Chapter 14a](#), Table 5. No specific management is required for individuals with a family history of allergies.

The MHRA will continue to closely monitor anaphylaxis post-COVID-19 vaccination; reporting of adverse events via the [Coronavirus Yellow Card reporting scheme](#) is strongly encouraged.

### Storage

Vaccines should be stored according to the conditions detailed in the [Storage](#) section below.

However, in the event of an inadvertent or unavoidable deviation of these conditions, refer to [Vaccine Incident Guidance](#). Where vaccines are assessed in accordance with these guidelines as appropriate for continued use, this constitutes off-label administration under this protocol.

In the event that available data supports extension to the vaccine shelf life, any resulting off-label use of expiry extended vaccine under this protocol should be supported by NHS operational guidance or standard operating procedure.

Where a vaccine is recommended off-label consider, as part of the consent process, informing the individual, parent or carer the vaccine is being offered in accordance with national guidance but that this is outside the product licence.

### Drug interactions

Immunological response may be diminished in those receiving immunosuppressive treatment, but it is important to still immunise this group.

Although no data for co-administration of COVID-19 vaccine with other vaccines exist, in the absence of such data, first principles would suggest that interference between inactivated vaccines with different antigenic content is likely to be limited. Based on experience with other vaccines, any potential interference is most likely to result in a slightly attenuated immune response to one of the vaccines. There is no evidence of any safety concerns, although it may make the attribution of any adverse events more difficult.

Similar considerations apply to co-administration of inactivated (or non-replicating) COVID-19 vaccines with live vaccines such as MMR. In particular, live vaccines which replicate in the mucosa, such as live attenuated influenza vaccine (LAIV) are unlikely to be seriously affected by concomitant COVID-19 vaccination.

For further information about co-administration with other vaccines, see [Additional Information](#) section.

### Identification and management of adverse reactions

The most frequent adverse reactions in children and young people 5 to 17 years of age are injection-site pain, fatigue, headache, injection-site redness and swelling, fever, myalgia and chills.

Very rare cases of myocarditis and pericarditis have been observed following COVID-19 mRNA vaccination. These cases have primarily occurred within 14 days following vaccination, more often after the second vaccination and more often in younger males. Available data suggest that the course of myocarditis and pericarditis following vaccination is not different from myocarditis or pericarditis in general. Healthcare professionals should be alert to the signs and symptoms of myocarditis and pericarditis. Individuals, parents and carers should be instructed to seek immediate medical attention if they develop symptoms indicative of myocarditis or pericarditis such as acute and persisting chest pain, shortness of breath, or palpitations following vaccination. Healthcare professionals should consult [guidance](#) and/or specialists to diagnose and treat this condition.
<table>
<thead>
<tr>
<th>Identification and management of adverse reactions (continued)</th>
<th>Heavy menstrual bleeding has been reported after vaccination with mRNA vaccines. In most cases, this is self-limiting. Individuals, parents and carers should be provided with the advice within the leaflet <em>What to expect after your child's COVID-19 vaccination</em>, which covers the reporting of adverse reactions and their management, such as with analgesic and/or antipyretic medication. A detailed list of adverse reactions across all age groups is available in the product's SPC.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reporting procedure of adverse reactions</td>
<td>The MHRA has a specific interest in the reporting of all adverse drug reactions for new COVID-19 vaccines. Healthcare professionals and individuals, parents and carers should report suspected adverse reactions to the MHRA using the <em>Coronavirus Yellow Card reporting scheme</em> or search for MHRA Yellow Card in the Google Play or Apple App Store. Any adverse reaction to a vaccine should also be documented in the individual’s record and the individual’s GP should be informed. <em>Chapter 14a</em> and <em>Chapter 8</em> provide further details regarding the clinical features of reactions to be reported as ‘anaphylaxis’. Allergic reactions that do not include the clinical features of anaphylaxis should be reported as ‘allergic reaction’.</td>
</tr>
</tbody>
</table>
| Written information to be given to the individual, parent or carer | Ensure the individual, parent or carer has been provided appropriate written information such as the:  
- Patient Information Leaflet (PIL) for *Comirnaty® Omicron XBB.1.5 (30 micrograms/dose)*, *Comirnaty® Omicron XBB.1.5 (10 micrograms/dose)* or *Comirnaty® Original/Omicron BA.4-5 (15/15 micrograms)* COVID-19 mRNA vaccine as appropriate  
- COVID-19 vaccination record card  
- *what to expect after your child's COVID-19 vaccination*  
- *a guide for parents of children aged 5 to 11 years*  
- *a guide for parents of children aged 5 to 11 years of age at high risk*  
- *a guide for eligible children and young people aged 12 to 17*  
- *COVID-19 vaccination: women who are pregnant or breastfeeding*  
- *waiting after COVID-19 vaccination*  
For resources in accessible formats and alternative languages, please visit *Home - Health Publications*. Where applicable, inform the individual, parent or carer that large print, Braille or audio CD PILs may be available from emc accessibility (freephone 0800 198 5000) by providing the medicine name and product code number, as listed on the electronic Medicines Compendium. |
| Advice and follow up treatment | The 15 minute observation following vaccination with COVID-19 vaccines has been suspended for individuals without a history of allergy (see off-label use section). Following COVID-19 vaccine administration, individuals without a history of allergy should be:  
- observed for any immediate reactions whilst they are receiving any verbal post vaccination information and exiting the premises  
- informed about the signs and symptoms of anaphylaxis and how to access immediate healthcare advice in the event of displaying any symptoms (see leaflets *What to expect after your child's COVID-19 vaccination* and *Waiting after COVID-19 vaccination*)  
Individuals with a personal history of allergy should be managed in line with *Chapter 14a*, Table 5 of the Green Book. Inform the individual, parent or carer of possible side effects and their management. |
**Advice and follow up treatment (continued)**

Where applicable, individuals should be advised not to drive for 15 minutes after vaccination, as fainting can occur.

The individual, parent or carer should be advised to seek appropriate advice from a healthcare professional in the event of an adverse reaction. In some settings, for example domiciliary vaccination, this may require a responsible adult to be present for at least 15 minutes after vaccination.

The individual, parent or carer should be advised to seek immediate medical attention should the vaccinated child experience new onset of chest pain, shortness of breath, palpitations or arrhythmias.

Advise the individual, parent or carer they can report side effects directly via the national reporting system run by the MHRA known as the [Coronavirus Yellow Card reporting scheme](https://www.mhra.gov.uk/yellowcard) or by searching for MHRA Yellow Card in the Google Play or Apple App Store. By reporting side effects, they can help provide more information on the safety of medicines.

As with all vaccines, immunisation may not result in protection in all individuals. The individual, parent or carer should be advised that immunosuppressed individuals may not make a full immune response to the vaccine.

When applicable, advise the individual, parent or carer when to return for vaccination or when a subsequent vaccine dose is due.

<table>
<thead>
<tr>
<th>Special considerations and additional information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ensure there is immediate access to an anaphylaxis pack including adrenaline (epinephrine) 1 in 1,000 injection and easy access to a telephone at the time of vaccination.</td>
</tr>
<tr>
<td>Minor illnesses without fever or systemic upset are not valid reasons to postpone vaccination. If an individual is acutely unwell, vaccination should be postponed until they have fully recovered. This is to avoid confusing the differential diagnosis of any acute illness (including COVID-19) by wrongly attributing any signs or symptoms to the adverse effects of the vaccine. Ideally consent of someone with parental responsibility should be sought. Children can self-consent only if assessed as Gillick competent (see Chapter 2 of the Green Book).</td>
</tr>
<tr>
<td><strong>Individuals vaccinated abroad</strong></td>
</tr>
<tr>
<td>Children and young people who have been vaccinated abroad are likely to have received an mRNA vaccine based on the spike protein, or an inactivated whole viral vaccine. Specific advice may be found in <a href="https://www.gov.uk/government/publications/covid-19-vaccination-programme-information-for-healthcare-practitioners">COVID-19 vaccination programme: information for healthcare practitioners</a>.</td>
</tr>
<tr>
<td><strong>Previous incomplete vaccination</strong></td>
</tr>
<tr>
<td>Vaccination can be resumed provided a minimum interval of 3 months has been observed and the individual continues to be eligible for the current seasonal campaign. There is no need to administer extra doses to compensate for previously missed primary or booster doses, even if the individual was previously eligible.</td>
</tr>
<tr>
<td><strong>Co-administration with other vaccines</strong></td>
</tr>
</tbody>
</table>
| Where individuals in an eligible cohort present having recently received one or more inactivated or live vaccines, COVID-19 vaccination should still be given. The same applies for most other live and inactivated vaccines where COVID-19 vaccination has been received first or where an individual presents requiring 2 or more vaccines. It is generally better for vaccination to proceed to prevent any further delay in protection and avoid the risk of the individual not returning for a later appointment. This includes but is not limited to vaccines commonly administered around the same time or in the same settings (including LAIV,
Special considerations and additional information (continued)

HPV, influenza, MenACWY and Td-IPV vaccines in the school age programmes and pertussis in pregnancy).

Where co-administration does occur, the individual, parent or carer should be informed about the likely timing of potential adverse events relating to each vaccine.

**Immunosuppressed**

Immunological response may be lower in immunocompromised individuals, but they should still be vaccinated.

Individuals who had received brief immunosuppression (≤2mg/kg prednisolone per day) for an acute episode of asthma and individuals on replacement corticosteroids for adrenal insufficiency are not considered severely immunosuppressed sufficient to have prevented response to the primary vaccination.

**Individuals with severe immunosuppression**

The need for additional doses for individuals who have severe immunosuppression (as defined by Box 1 or Box 2, Chapter 14a) should be at the discretion of the individual’s specialist.

A minimum 3 month interval between doses is recommended. However, for individuals about to receive planned treatment, a minimum interval of 3 weeks between COVID-19 doses may be followed, to enable the vaccine to be given whilst the individual’s immune system is better able to respond. Ideally, vaccination should take place 2 weeks before immunosuppressive treatment commences, or until 2 weeks after the period of immunosuppression, in addition to time needed for clearance of the therapeutic agent. If not possible, consideration could be given to vaccination during a treatment holiday or when the degree of immunosuppression is at a minimum.

Due consideration must be given to the risk of delaying COVID-19 vaccination against that of delaying treatment.

More information on optimal timing of doses for this group may be found in Chapter 14a. Such individuals should be given a dose under a PSD.

Individuals who have received a bone marrow transplant after vaccination should be considered for a re-immunisation programme for all routine vaccinations and for COVID-19 (see Chapter 7 of the Green Book). This is not covered by this protocol and should be provided on a patient-specific basis.

**Pregnancy**

There is no known risk associated with being given a non-live vaccine during pregnancy (see Chapter 14a).

In December 2021, following the recognition of pregnancy as a risk factor for severe COVID-19 infection and poor pregnancy outcomes during the Delta wave, pregnancy was added to the clinical risk groups recommended COVID-19 vaccination.

Because of wider experience with mRNA vaccines, these are the preferred vaccines to offer to those who are pregnant.

**Breastfeeding**

There is no known risk associated with being given a non-live vaccine whilst breastfeeding. JCVI advises that breastfeeding females may be offered any suitable COVID-19 vaccine. Emerging safety data is reassuring: mRNA was not detected in the breast milk of recently vaccinated females and protective antibodies have been detected in breast milk.

(continued over page)
### Special considerations and additional information (continued)

The developmental and health benefits of breastfeeding are clear and should be discussed with the female, along with her clinical need for immunisation against COVID-19.

</tbody>
</table>

**Thawed vial**

Up to 10 weeks storage and transportation at 2°C to 8°C within the overall product shelf life.

If the vaccine is received at 2°C to 8°C, it should be stored at 2°C to 8°C. Except where a shelf-life extension applies, the 10 week shelf life should not exceed the printed manufacturer’s expiry date (EXP) on the outer carton.

Prior to use, the unopened vials can be stored for up to 12 hours at temperatures between 8°C to 30°C.

Thawed vials can be handled in room light conditions.

Once thawed, the vaccine should not be re-frozen.

**Punctured vial**

Chemical and physical in-use stability has been demonstrated for 12 hours at 2°C to 30°C, which includes up to 6 hours transportation time for all Comirnaty® products in scope of this protocol. From a microbiological point of view, unless the method of dilution precludes the risk of microbial contamination, the product should be used as soon as practicably possible. Otherwise, in-use storage times and conditions are the responsibility of the user.
Storage (continued)

Special precautions for storage
Store in original packaging to protect from light.
During storage, minimise exposure to room light and avoid exposure to direct sunlight and ultraviolet light.

Vaccine preparation

General principles
Vaccines should be prepared in accordance with manufacturer’s recommendations (see the product’s SPC) and NHS standard operating procedures for the service.
The name of the vaccine must be checked to ensure the correct vaccine is being used (as summarised in Table 3).
Swirl the vial gently after thawing and between each withdrawal. Do not shake.
Vials should be inspected for particles and discolouration not in line with the product SPC before preparation and administration. Should either occur, discard the vial in accordance with local procedures.
The vaccine may be drawn up and administered by the same person or separate persons with the required competence and supervision. If the vaccine is to be administered by a person other than the person preparing it, ensure that there are clear procedures for transferring the vaccine to the vaccinator in a safe way, allowing for appropriate checks of vaccine particulars, batch number and expiry by both parties.
To extract the anticipated number of doses from a single vial, low dead-volume syringes and/or needles should be used, with a combined dead volume of no more than 35 microlitres. If standard syringes and needles are used, there may not be sufficient volume to extract a sixth dose from a single vial.
Care should be taken to ensure a full dose is given as outlined in Table 3. Each dose must contain the correct volume of vaccine. If a full dose cannot be extracted from the remaining amount in the vial, discard the vial and any excess volume. Do not pool excess vaccine from multiple vials.
Recheck the product name, batch number and expiry date immediately prior to administration.

Comirnaty® vaccine verification
Verify that the vial has the correct coloured plastic cap and the label matches the intended vaccine to be administered.

<table>
<thead>

</tr>
<tr>
<td>Comirnaty® Original/Omicron BA.4-5 (15/15 micrograms)</td>
<td>Grey</td>
</tr>
</tbody>
</table>

Handling prior to use
Ensure vials are completely thawed prior to use.
Allow the thawed vial to come to room temperature and gently invert 10 times prior to administration. Do not shake.
Prior to administration, the thawed dispersion may contain white to off-white opaque amorphous particles.

Do not dilute the vial contents if administering Comirnaty® Omicron XBB.1.5 (30 and 10 micrograms/dose) or Comirnaty® Original/ Omicron BA.4-5.
The vials should be marked with the appropriate expiry date and time.

| Disposal                      | Follow local clinical waste policy and NHS standard operating procedures and ensure safe and secure waste disposal. |
|-------------------------------| Equipment used for vaccination, including used vials, ampoules, or discharged vaccines in a syringe or applicator, should be disposed of safely and securely according to local authority arrangements and NHSE guidance (HTM 07-01): Management and disposal of healthcare waste. |
Stage 3: Vaccine administration

Before administering the vaccine, ensure:

1. The individual has been assessed in accordance with stage one of this protocol.
2. The vaccine to be administered has been identified, by the registered practitioner consenting the individual, as Comirnaty® COVID-19 mRNA vaccine appropriate for the individual’s age (as per Table 3).
3. Consent for vaccination has been provided and documented'.

Administer Comirnaty® COVID-19 mRNA Vaccine and provide any post-vaccination advice.

</tr>
</tbody>
</table>

Quantity to be supplied and administered

As per Table 3.

Route and method of administration

Administer the required dose of COVID-19 vaccine (as indicated in Table 3 above) by intramuscular injection only, preferably into the deltoid muscle of the upper arm.

Vaccinators should prepare the dose in accordance with Stage 2 above. Where it is within their competence, experienced vaccinators may draw the required dose from a vial prepared by another person, under the supervision of a doctor, nurse, or pharmacist, in accordance with Stage 2.

If vaccine is not prepared by the vaccinator, safe procedures must be in place for the vaccinator to safely receive, check, and use the vaccine immediately after preparation. The name of the vaccine must be checked to ensure the intended vaccine is being used (as summarised in Table 3).

Where the individual has been assessed as being at increased risk of bleeding, a fine needle (23 gauge or 25 gauge) should be used for the vaccination, followed by firm pressure applied to the site (without rubbing) for at least 2 minutes. The individual or carer should be informed about this risk of haematoma from the injection.

Care should be taken to ensure a full dose is administered, as summarised in Table 3. Where a full dose cannot be extracted, the remaining vial volume must be discarded. Do not pool excess vaccine from multiple vials.

(continued over page)

---

5 As outlined in the Green Book, vaccines that target the latest variant are preferable. However, an available, authorised and age-appropriate vaccine should be offered without delay, particularly to individuals at highest risk.
| Route and method of administration (continued) | Recheck product name, batch number and expiry date prior to administration. Specific handling requirements of each vaccine is outlined in the Storage and Vaccine preparation sections above. |
| Disposal | Follow local clinical waste policy and NHS standard operating procedures and ensure safe and secure waste disposal. Equipment used for vaccination, including used vials, ampoules, or discharged vaccines in a syringe or applicator, should be disposed of safely and securely according to local authority arrangements and NHSE guidance (HTM 07-01): Safe management of healthcare waste |
| Post-vaccination advice | Ensure the individual, parent or carer has been provided appropriate written information such as the: • Patient Information Leaflet (PIL) for Comirnaty® Omicron XBB.1.5 (30 micrograms/dose), Comirnaty® Omicron XBB.1.5 (10 micrograms/dose) or Comirnaty® Original/Omicron BA.4-5 (15/15 micrograms) COVID-19 mRNA vaccine as appropriate • COVID-19 vaccination record card • what to expect after your child’s COVID-19 vaccination • a guide for parents of children aged 5 to 11 years • a guide for parents of children aged 5 to 11 years of age at high risk • a guide for eligible children and young people aged 12 to 17 • a guide for eligible children and young people aged 16 to 17 • COVID-19 vaccination: women who are pregnant or breastfeeding • waiting after COVID-19 vaccination For resources in accessible formats and alternative languages, please visit Health Publications - Home. Where applicable, inform the individual, parent or carer that large print, Braille or audio CD PILs may be available from emc accessibility (freephone 0800 198 5000) by providing the medicine name and product code number, as listed on the electronic Medicines Compendium. |
## Stage 4: Recording vaccine administration

| Activity stage 4: | Complete a record of vaccination for the individual and in accordance with local policy.  
| The required records should be completed by the person who is undertaking the recorded activity or a designated record keeper who is a witness to the activity undertaken. |
| Records | The practitioner must ensure the following is recorded:  
- that valid informed consent was given or a decision to vaccinate was made in the individual’s best interests in accordance with the [Mental Capacity Act 2005](#)  
- name of individual, address, date of birth and GP with whom the individual is registered (or record where an individual is not registered with a GP)  
- name of supervisor, immuniser and where different from the immuniser, ensure the professional assessing the individual, person preparing the vaccine and person completing the vaccine record are identified  
- name and brand of vaccine  
- date of administration  
- dose, form and route of administration of vaccine  
- quantity administered  
- batch number and expiry date  
- anatomical site of vaccination  
- advice given, including advice given if excluded or declines immunisation  
- details of any adverse drug reactions and actions taken  
- supplied via national protocol  

All records should be clear, legible and contemporaneous.  
As a variety of COVID-19 vaccines are available, it is especially important that the exact brand of vaccine, batch number and site at which each vaccine is given is accurately recorded in the individual’s records.  
It is important that vaccinations are recorded in a timely manner on appropriate health care records for the individual. Systems should be in place to ensure this information is returned to the individual’s general practice record in a timely manner to allow clinical follow up and to avoid duplicate vaccination.  
A record of all individuals receiving treatment under this protocol should also be kept for audit purposes in accordance with local and national policy.
