1. Scope

1.1 Prescribed Specialised Service

This service specification covers the provision of interventional neuroradiology services and should be read alongside the Neurosciences Specialised Neurology Service Specification and Neurosurgery (Adult) Service Specification.

1.2 Description

Neuroradiology is a subspecialty of radiology which involves the investigation and treatment of patients with neurological diseases. Modern imaging requirements and the development of image guided interventions has resulted in a large increase in neuroradiology workload. It is important that this work is managed safely within a service that is fit for purpose. Important integrated responsibilities include training and education, research and development and close working with colleagues in a wide variety of other specialties through multidisciplinary team (MDT) working.

2. Care Pathway and Clinical Dependencies

Imaging in the management of acute and chronic neurological disease is reflected in increased demand for neuroimaging which is now required on a 24/7 basis.

A combined interventional neuroradiology service must provide endovascular aneurysm treatment as well as a stroke thrombectomy service. The requirements to do this include:

- Immediate neurosurgical & neurocritical care support co-located on the same site as the interventional neuroradiology service
- Robust arrangements in place to facilitate the discussion of all subarachnoid haemorrhage (SAH) aneurysm cases with a Consultant Neurovascular Neurosurgeon
- A functioning neurovascular MDT for case review including morbidity and mortality of SAH cases
- Anaesthetic support such that 2 angiography suites can be staffed, if necessary, at the same time during daytime, (when it is much more likely to see two simultaneous treatments requiring intervention.)
- 24 hour access to the appropriate diagnostic modalities with staff cover to enable this service to be provided safely and robustly including:
  - Immediate/next available slot access to multislice CT (16 slice or greater) dedicated to the neurosciences department
  - 24/7 access to a high field strength MRI scanner with Echo Planar Imaging and multichannel head coils
Additional equivalent CT and MR scanners should be available on site to support
downtime and periods of increased demand

- There must be appropriate access to high resolution biplane digital angiographic
equipment with rotational 3D capability and appropriate software for image
manipulation

- On site access to an appropriate second angiographic facility to cover periods of
down time is essential

- There must be appropriate IT infrastructure to include adequate access to home
workstations and remote visualisation of imaging studies in support of a hub and
spoke neuroscience service models

- Selection of patients for mechanical clot retrieval for treating acute ischaemic
stroke should be done by clinicians experienced in the use of thrombolysis for
stroke and in interpretation of relevant imaging

- Selected patients must comply with the criteria for treatment within the clinical
policy. (insert link)

- The procedure should only be carried out by appropriately trained specialists with
regular experience in intracranial endovascular interventions, with appropriate
facilities and neuroscience support

- Patients must be cared for on a ward with specialist expertise in the care of acute
stroke (either a hyperacute stroke unit (HASU) ward or equivalent)

- Ensuring that early secondary prevention interventions are commenced as
appropriate and that advice on secondary prevention is included in handover
documentation for patients transferring back to local services. (For patients who are
discharged home or to community care the thrombectomy service must ensure that
comprehensive secondary prevention assessment, investigation and treatment are
arranged).

2.1 Care Pathways

Thrombectomy
Patients will be admitted to their nearest HASU, which will undertake the initial investigations
including CT or MR angiography, start treatment with intravenous thrombolysis if that is appropriate
and then arrange critical transfer for thrombectomy for those who fulfil the criteria in the published
policy. The patient would normally be transferred for local rehabilitation and inpatient care, if
needed, within 24-72 hours.

Subarachnoid haemorrhage Patients will be seen in their local emergency departments and either
admitted for initial investigations to confirm the diagnosis and then urgently transferred to the
neuroscience centre, or if the diagnosis is made in the emergency department, transferred directly
to a neuroscience centre. Coiling or surgical clipping of an aneurysm should take place within 48
hours of the haemorrhage or if delayed presentation within 48 hours of presentation. Where
patients have residual neurological and or cognitive deficits ongoing treatment will usually be
undertaken in the local hospital, preferably on a stroke unit.

All images need to be made immediately available to the neurointerventionist who will be planning
and delivering treatment.

Following acceptance for transfer it is the referring unit’s responsibility to ensure a safe, rapid
transfer, if necessary via ambulance or helicopter, as clinically indicated and according to the time
critical nature of the treatment.

Please note that access to treatment will be guided by any applicable NHS England national clinical
commissioning policies.

2.2 Interdependence with other services
All interventional neuroradiology centres must be recognised by NHS England as one of their listed
centres for interventional neuroradiology and specifically, in accordance with the Neurosciences
Specialised Neurology Service Specification and Neurosurgery (Adult) Service Specification, should
have regard for the standards for providing safe acute ischaemic stroke thrombectomy services -
Most patients will be managed on the hyperacute stroke unit after intervention but a proportion will require ICU admission.

**Staff**

All centres must have sufficient clinicians with appropriate competencies to be able to provide a 24/7 service (an extended hours 7 day service may be acceptable whilst working towards full 24/7 provision.) Most eligible patients will present for treatment between 8 am and midnight.

Any post for aneurysm interventional neuroradiology work should have at least two nominated procedural sessions per week. Neurointerventional operators should undertake a minimum of 40 cerebral endovascular interventions per annum, of which a reasonable proportion are thrombectomy.

Centres must have immediate access to:
- Appropriately trained nurses
- Radiographers
- Anaesthetists & Operating Department Practitioners with neuroscience experience

**Stroke pathway requirements (commissioned by CCGs)**

HASU Centres will need access to:
- CT angiography 24/7 (extended hours 7 days per week may be acceptable whilst working towards 24/7 access. (HASU will already have access to 24/7 CT)
- Ambulance service agreement for critical patient transfers and
- Acute and stroke rehabilitation services commissioned such that that they are available for patients to be transferred back for local care within 24 hours of request by the centre

### 3. Population Covered and Population Needs

#### 3.1 Population Covered By This Specification

This service specification covers all ages.

#### 3.2 Population Needs

There are approximately 80,000 stroke admissions in England per year. Currently, around 12% of all stroke patients receive intravenous thrombolysis and the majority of patients suitable for thrombectomy will come from this group. It is estimated that up to 8,000 patients per year are eligible for treatment in England.

#### 3.3 Expected Significant Future Demographic Changes

None identified.

#### 3.4 Evidence Base

The service description and key requirements are based on the Standards for Providing Safe Acute Ischaemic Stroke Thrombectomy Services (September 2015) and the British Society of Neuroradiology guidance: BSNR training guidance for mechanical thrombectomy.

### 4. Outcomes and Applicable Quality Standards

#### 4.1 Quality Statement – Aim of Service

This service specification has considered the current stroke pathway, the need to ensure that investigations and treatment such as thrombolysis are carried out immediately and without delay, that the clinical commissioning criteria for thrombectomy are applied through the availability of the required imaging and expert assessment and that any intervention itself is provided by specialists with the required training and experience within appropriate units. The specification also recognises
the need for patients having thrombectomy to receive care on HASU wards or equivalent and to ensure that service are planned to ensure prompt transfer back to local inpatient or outpatient specialist rehabilitation services.

The objective is to ensure evidence based commissioning with the aim of improving outcomes for patients who experience a stroke and improve evidence based access to procedures as soon as possible after the onset of stroke symptoms.

- All centres must enter patients onto the Sentinel Stroke National Audit Programme (SSNAP) database, which is used to monitor and audit stroke treatment and outcomes.

**NHS Outcomes Framework Domains**

<table>
