

NHS Standard Contract 2025/26: Minimising *Clostridioides difficile* and Gram-negative bloodstream infections

April 2025, Version 3

Introduction

As was the case in previous years, the NHS Standard Contract 2025/26 includes quality requirements for NHS trusts and NHS foundation trusts to minimise *Clostridioides difficile* (*C. difficile*) and Gram-negative Bloodstream Infections (GNBSIs) rates to threshold levels set by NHS England.

Healthcare-associated infections (HCAIs) remain a significant challenge across NHS England, with evidence pointing to multifaceted drivers behind the rising incidence of GNBSIs, other resistant infections, and antimicrobial resistance (AMR). Contributing factors include variations in antimicrobial stewardship (AMS), diagnostic practices, and application of infection prevention and control (IPC) measures.

Health and social care providers have obligations set out in the Health and Social Care Act 2008: code of practice on the prevention and control of infections to undertake steps to keep patients and staff safe and to provide assurance to trust boards about the risk and outcome.

These requirements support the delivery of the AMR National Action Plan 2024-29¹ which includes a target to prevent any increase in all GNBSIs from the 2019/20 baseline by 2029, and is not limited only to HCAIs. Preliminary projections of the aging population between now and 2029 means that this in reality could represent a 17% reduction in underlying trends. The NAP also includes a target to prevent any increase in a specified set of drug-resistant infections in humans from the 2019/20 baseline by 2029.

While not part of the Standard Contract requirements, as in previous years, this document sets out the thresholds included on a guidance/advisory basis for equivalent thresholds for sub-ICBs (at ICB level previously), reflecting that the prevention of infections requires preventative, pathway-based approaches. Having targets within the new NAP focussed upon all GNBSIs, not just healthcare-associated, supports this approach.

The 2024-29 NAP targets mean that appropriate thresholds to support achievement will not be comparable to those set in previous years. Therefore, there is a need to support trusts and sub-ICBs to transition to the new targets.

¹ [UK 5-year action plan for antimicrobial resistance 2024 to 2029 - GOV.UK \(www.gov.uk\)](https://www.gov.uk/government/consultations/uk-5-year-action-plan-for-antimicrobial-resistance-2024-to-2029)

While these thresholds set clear targets, their effectiveness is hindered by challenges such as varying trust capacities, differing patient demography, and increasing trends in infection rates. To ensure thresholds are both practical and impactful, enhancing the reliability of data and addressing existing gaps is critical. Metrics alone do not provide the full picture; a deeper understanding of underlying issues is required to drive meaningful improvements.

The thresholds for each trust and sub-ICB, together with the methodology used to identify these, are set out in this document.

Key changes from the 2025/26 thresholds:

- In addition to trust thresholds, publication of thresholds at sub-ICB level are included (previously published at ICB level).
- Due to the increasing trends, the approach for each trust and sub-ICB is, their 2025/26 thresholds for GNBSIs and for C.difficile are the lower of :
 - their 2024/25 thresholds
 - or
 - 10% decrease on 2024 calendar year cases,

i.e. whichever of the above options leads to a threshold which reflects the largest reduction from their 2024 calendar year cases
- As part of ongoing preparations for future inclusion of blood culture and CDI testing data into threshold assessments, trusts are asked to ensure testing data completeness within the quarterly mandatory laboratory returns (QMLR), to facilitate identification of positivity rates from blood culture sampling and CDI stool testing. Details of the metrics and current positions by trust are set out in table 5 on page 37.

Scope of the thresholds

Since April 2017, reporting trusts have been asked to provide information on whether patients with *C. difficile* had been admitted to the reporting trust within the three months prior to the onset of the current case. This allows a greater granulation of the healthcare association of cases.

Table 1: The six prior healthcare exposure groups for *C. difficile*

Prior healthcare exposure group	Definition
Hospital-onset healthcare-associated (HOHA)	Specimen date is ≥ 3 days after the current admission date* (where day of admission is day 1)
Community-onset healthcare-associated (COHA)	Is not categorised HOHA and the patient was most recently discharged from the same reporting trust in the 28 days prior to the specimen date (where day 1 is the specimen date)
Community-onset, indeterminate association (COIA)	Is not categorised HOHA and the patient was most recently discharged from the same reporting trust between 29 and 84 days prior to the specimen date (where day 1 is the specimen date)
Community-onset, community associated (COCA)	Is not categorised HOHA and the patient has not been discharged from the same reporting organisation in the 84 days prior to the specimen date (where day 1 is the specimen date)
Unknown	The reporting trust answered 'Don't know' to the question regarding previous discharge in the 3 months prior to the case
No information	The reporting trust did not provide any answers to questions on prior admission

* admission date refers to the date of admission to the reporting acute Trust, or where the patient was admitted via A&E (of the same reporting Trust), the decision to admit date

** as a result of this definition change, case classifications will change from community-onset to hospital-onset

From April 2020, reporting trusts were asked to provide information on whether patients with Gram-negative bloodstream infections had been admitted to the reporting trust within one month prior to the onset of the current case. This allows a greater granulation of the healthcare association of cases.

Table 2: The five prior healthcare exposure groups for Gram-negative bloodstream infections

Prior healthcare exposure group	Definition
Hospital-onset healthcare-associated (HOHA)	Specimen date is ≥ 3 days after the current admission date* (where day of admission is day 1)
Community-onset healthcare-associated (COHA)	Is not categorised HOHA and the patient was most recently discharged from the same reporting trust in the 28 days prior to the specimen date (where day 1 is the specimen date)
Community-onset, community associated (COCA)	Is not categorised HOHA and the patient has not been discharged from the same reporting organisation in the 28 days prior to the specimen date (where day 1 is the specimen date)
Unknown	The reporting trust answered 'Don't know' to the question regarding previous discharge in the month prior to the case
No information	The reporting trust did not provide any answers to questions on prior admission

* admission date refers to the date of admission to the reporting acute Trust, or where the patient was admitted via A&E (of the same reporting Trust), the decision to admit date

** as a result of this definition change, case classifications will change from community-onset to hospital-onset

For 2025/26, as previously for 2021/22, 2022/23 , 2023/24 and 2024/25, trust-level thresholds comprise total healthcare-associated cases (i.e. HOHA and COHA).

Sub-ICB thresholds

While not currently part of the NHS Standard Contract requirements, a focus across Integrated Care Boards (ICBs) on reducing infection levels is also important. Actions to reduce the risk of infections and to support early diagnosis and appropriate treatment will have beneficial effects for both patient outcomes and service demand. To support this, thresholds are provided for sub-ICBs (which can be aggregated to ICB²). In contrast to the thresholds for trusts, which only include healthcare-associated cases, sub-ICB thresholds include total cases (i.e. all categories listed above).³

Trust thresholds

Trusts are required under the NHS Standard Contract 2025/26 to minimise rates of both *C. difficile* and of Gram-negative bloodstream infections so that they are no higher than the threshold levels set by NHS England.

The following table sets out the threshold levels for each trust's count of healthcare-associated (i.e. HOHA plus COHA) cases. These are calculated on the basis outlined in table 3 below.

Trust thresholds for GNBSIs and for *C.difficile* are the lower of :

- their 2024/25 thresholds
- or
- 10% decrease on 2024 calendar year cases

All thresholds were rounded down to the nearest whole number and pertain to healthcare-associated cases (i.e. HOHA and COHA cases).

² Originally 2024/25 thresholds were calculated at ICB level. The recalculation at sub-ICB level may, due to rounding, result in sub-ICB targets that when aggregated to ICB level are slightly lower than the original ICB targets

³ Sub-ICB thresholds are calculated on the basis of postcode based boundaries , whereas trust thresholds are based on hospital activity which is not strictly determined by boundaries

Sub-ICB thresholds

A focus across sub-ICBs on reducing infection levels is important as actions to reduce the risk of infections and to support early diagnosis and appropriate treatment will have beneficial effects for both patient outcomes and service demand.

The following table therefore sets out the threshold levels for *C. difficile* and for Gram negative bloodstream infections at sub-ICB level. In contrast to the thresholds for trusts, which include healthcare-associated cases only, the sub-ICB thresholds include total cases (i.e. all categories listed in Tables 1 and 2). These are calculated on the basis outlined in table 4 below.

Sub-ICB thresholds for GNBSIs and for *C.difficile* are the lower of:

- their 2024/25 thresholds
- or
- 10% decrease on 2024 calendar year cases
- All thresholds were rounded down to the nearest whole number and pertain to total cases.

Table 4: *C. difficile* and Gram-negative bloodstream infections (*E. coli*, *Klebsiella* spp., *P. aeruginosa*)

Blood culture sampling and CDI testing data

The 2024/25 Standard Contract Thresholds document emphasised the need for robust data completion and quality assurance of the Quarterly Mandatory Laboratory Returns (QMLR) dataset, which underpins these new metrics. Organisations **are** required to complete and validate the accuracy of their submitted QMLR returns on a quarterly basis.

Details on processes for QMLR completion can be found [here](#).
